

ReadiUse™ Preactivated APC-Cy7 Maleimide

Catalog number: 2722
Unit size: 1 mg

Component	Storage	Amount
ReadiUse™ Preactivated APC-Cy7 Maleimide	Refrigerated (2-8 °C), Minimize light exposure	1 mg

OVERVIEW

APC-Cy7 is a popular tandem color used in flow cytometry. Its primary absorption peak is at 651 nm with emission peak at ~780 nm. AAT Bioquest offers this preactivated APC-Cy7 to facilitate the APC-Cy7 tandem conjugations to reduced antibodies and other biomolecules that contain a thiol group. Our preactivated APC-Cy7 maleimide is prepared from the commonly used crosslinker SMCC, and ready to conjugate. Allophycocyanin (APC) is a phycobiliprotein isolated from *Spirulina* sp., a blue-green alga. Like other phycobiliproteins, APC is fluorescent, with an extremely high absorptivity and a high quantum efficiency. It is a protein which can be easily linked to antibodies and other proteins by conventional protein cross-linking techniques without altering its spectral characteristics.

Antibody/APC-Cy7 conjugate solution is recommended to be stored at 2~8 °C and kept from light.

DISCLAIMER

AAT Bioquest provides high-quality reagents and materials for research use only. For proper handling of potentially hazardous chemicals, please consult the Safety Data Sheet (SDS) provided for the product. Chemical analysis and/or reverse engineering of any kit or its components is strictly prohibited without written permission from AAT Bioquest. Please call 408-733-1055 or email info@aatbio.com if you have any questions.

SAMPLE EXPERIMENTAL PROTOCOL

Reduction of Antibody

1. Prepare a fresh solution of 1.0 M DTT (15.4 mg/100 µL) in distilled water. Antibody solutions should be at 2 mg/mL or higher for best results. The reduction can be carried out in different buffers for example: MES, phosphate, and TRIS buffers (pH range 6 to 8). The antibody should be concentrated if less than 2 mg/mL.
2. Add 2 µL of 1.0 M DTT stock per 100 µL of antibody solution and mix well. Let the antibody solution stand at room temp for 30 minutes without additional mixing (to minimize reoxidation of cysteines to cystines).
3. Purify the reduced antibody over a desalting column pre-equilibrated with 50 mM MES Buffer (pH=6.0-6.5) with 2 mM EDTA. (Desalting column: <https://www.aatbio.com/products/readiuse-bio-gel-p-6-spin-column?unit=60500>)
4. Measure the Antibody concentration with Nanodrop. (Con. (mg/ml)= A280nm/1.4) **Note:** The reduced antibody is not stable; the conjugation reaction needs to be carried out the conjugation as soon as possible after purification.

Conjugate with ReadiUse™ Preactivated APC-Cy7 Maleimide

1. Reconstitute ReadiUse™ Preactivated APC-Cy7 Maleimide in 100 µL ddH₂O to 10 mg/mL. Note: Reconstituted ReadiUse™ Preactivated APC-Cy7 Maleimide are stable at 4 °C for one week, please kept it from light.
2. Add reduced antibody to pre-activated APC-Cy7 directly to at the ratio of 130 µg APC-Cy7 /100 µg reduced antibody.
3. Rotate the mixture for 60-120 mins at room temperature.
4. After 60 minutes, block the free sulfhydryls on the antibody.
5. Prepare a fresh solution of 10 mg/mL NEM in DMSO; add 3.4 µL per mg of antibody and rotate for 20 minutes at room temperature.

Purification

1. Antibody/APC-Cy7 conjugate could be further purified through size exclusion chromatography to get best performance. **Note:** The
