Background	This gene is a member of the protocadherin alpha
	gene cluster, one of three related gene clusters
	tandemly linked on chromosome five that
	demonstrate an unusual genomic organization
	similar to that of B-cell and T-cell receptor gene
	clusters. The alpha gene cluster is composed of 15
	cadherin superfamily genes related to the mouse
	CNR genes and consists of 13 highly similar and 2

more distantly related coding sequences. The tandem array of 15 N-terminal exons, or variable exons, are followed by downstream C-terminal exons, or constant exons, which are shared by all genes in the cluster. The large, uninterrupted N-terminal exons each encode six cadherin ectodomains while the C-terminal exons encode the cytoplasmic domain. These neural cadherin-like cell adhesion proteins are integral plasma membrane proteins that most likely play a critical role in the establishment and function of specific cell-cell connections in the brain. Alternative splicing has been observed and additional variants have been suggested but their full-length nature has yet to be determined. [provided by RefSeq, Jul 2008],
