Background	olfactory receptor family 2 subfamily A member
	5(OR2A5) Homo sapiens Olfactory receptors
	interact with odorant molecules in the nose, to
	initiate a neuronal response that triggers the
	perception of a smell. The olfactory receptor
	proteins are members of a large family of
	G-protein-coupled receptors (GPCR) arising from

single coding-exon genes. Olfactory receptors share a 7-transmembrane domain structure with many neurotransmitter and hormone receptors and are responsible for the recognition and G protein-mediated transduction of odorant signals. The olfactory receptor gene family is the largest in the genome. The nomenclature assigned to the olfactory receptor genes and proteins for this organism is independent of other organisms.
