Background	The protein encoded by this gene is part of the large
	ATP-dependent chromatin remodeling complex
	SWI/SNF, which is required for transcriptional
	activation of genes normally repressed by
	chromatin. The encoded protein, either alone or
	when in the SWI/SNF complex, can bind to 4-way
	junction DNA, which is thought to mimic the

topology of DNA as it enters or exits the nucleosome. The protein contains a DNA-binding HMG domain, but disruption of this domain does not abolish the DNA-binding or nucleosome-displacement activities of the SWI/SNF complex. Unlike most of the SWI/SNF complex proteins, this protein has no yeast counterpart. [provided by RefSeq, Jul 2008],
