

# DiagPoly™ Goat Anti-Mouse IgG (H&L) Fluorescent Polystyrene Particles, Yellow, 0.4-0.6 µm

Cat.No: DNM-SP23-037

## DESCRIPTION

|                    |                                                                                                                                                                                                                                                                                                                                     |
|--------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Description</b> | DiagPoly™ Goat Anti-Mouse IgG (H&L) Fluorescent Polystyrene Particles, Yellow, 0.4-0.6 µm are used in FACS based cell-binding analysis method for detecting protein-protein interaction and phagocytosis studies where the number of internalized microspheres per cell was determined from flow cytometry fluorescence histograms. |
|--------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

## PRODUCT INFORMATION

|                      |                                    |
|----------------------|------------------------------------|
| <b>Diameter</b>      | 0.4-0.6 µm                         |
| <b>Ligand</b>        | Goat Anti-Mouse IgG (H&L) Antibody |
| <b>Concentration</b> | 0.1% w/v                           |
