

Immune Receptor Cell Lines

Over-expressing cell lines are needed to screen for hits, while functional cell lines are needed for lead identification. To accelerate research progress of immune-checkpoint proteins, Creative Biogene has successfully constructed stable cell lines expressing the most popular immune receptors, used in cell-based assay for compound screening.

Immune Receptor are receptor proteins, usually existing in the cell membrane or intracellular of immune cells, which bind to specific extracellular signaling molecules (ligands) and cause a response in the immune system. The main immune receptors are Toll-like receptors (TLRs), B cell receptors, T cell receptors, pattern recognition receptors (PRRs), killer activation and inhibitory receptors (KARs and KIRs), and complement receptors.

Immune Checkpoints are immune receptors which can inhibit or stimulate signals to balance the immune responses and play a significant role in tumor immunotherapy. Blocking inhibitory immune checkpoints or activating stimulatory immune checkpoints has been proved to be an effective method for restoring effective immune surveillance and antitumor immune responses.

Creative Biogene has developed a series of stable cell lines expressing common immune receptors such as checkpoint proteins. Our expert team can also customize other immune receptor stable cell lines according to your experimental requirements to facilitate your immunotherapy projects.
